

Issues when running rails db:migrate:reset

- If you are getting an error that says `users.admin column not found`, follow these commands to restore that migration file
1. 'cd' into your migrate folder
 - `cd src/db/migrate`
 2. Edit the following migration file
 - `vi 20231130032647_set_user_admin_and_registered_defaults.rb`
 3. Press i to enter insert mode and add the following line:
 - `add_column :users, :admin, :integer`
 - Make sure to add this line before the `change_column_default`, it should be added right underneath `def change`

```
class SetUserAdminAndRegisteredDefaults < ActiveRecord::Migration[6.0]
  def change
    add_column :users, :admin, :integer
    change_column_default :users, :admin, '0'
    change_column_default :users, :registered, 'false'
  end
end
```

4. Press the escape key and type in `:wq` to escape and save changes.
5. Now re-run all the rake commands and your application should work
